

Additional Improvements

Exercise time: 40 minutes

Chevrons

Improve the `ListItem` component so it shows chevrons on the right side.

Bonus exercise: Make the chevrons optional. So, the `ListItem` component should have a boolean prop called **`showChevrons`**. With this, when using the `ListItem`, we can decide if we want to see the chevrons or not. I haven't implemented this in this section, though.

Long Text

Our **ListItem** and **Card** components look terrible if we give them long text. Long text should be truncated.

To fix this, set the **numberOfLines** prop of the **Text** component.

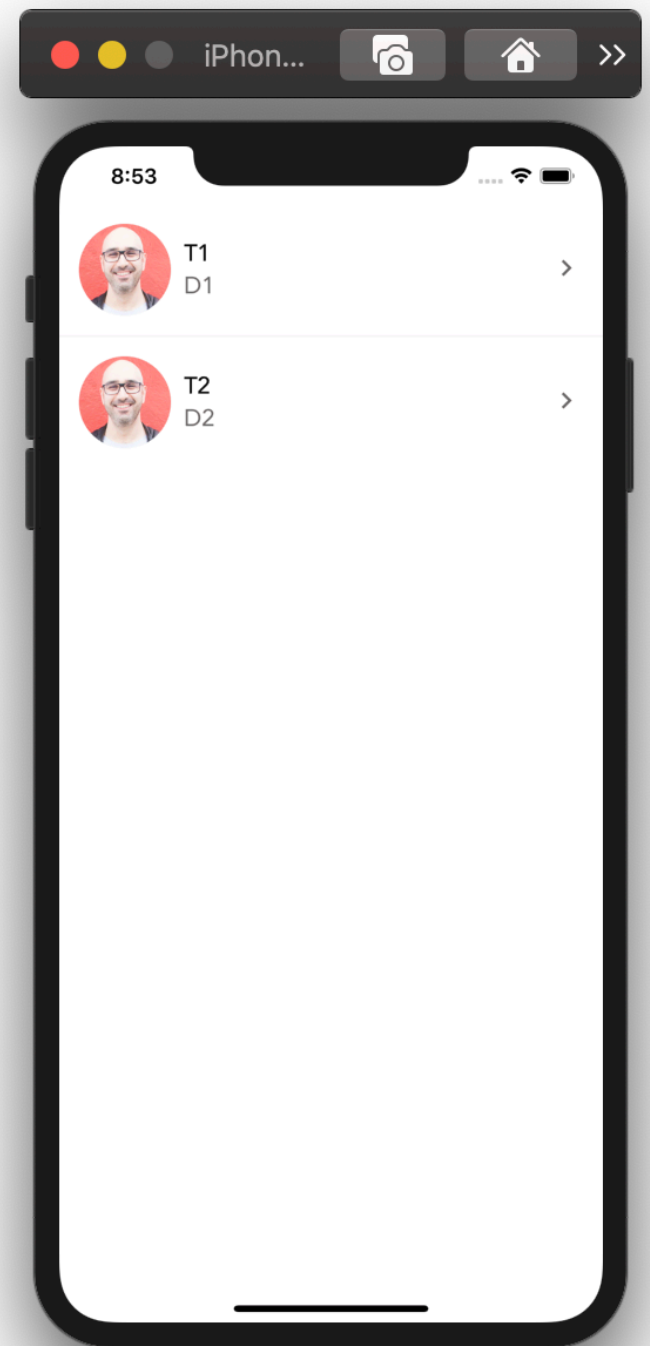

Messages Screen

Try pulling down the messages list to refresh it.
You'll see a cut-off right below the list.

We had this issue earlier in the course, but it's back!

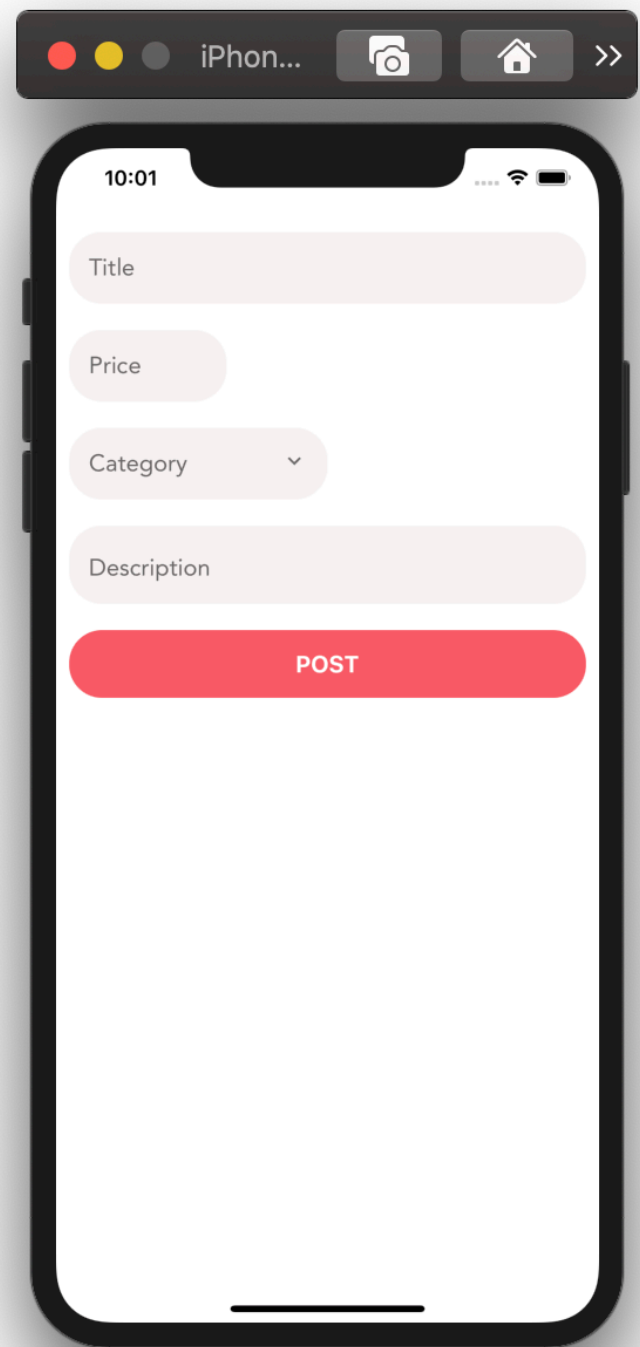

Tip: You only need to modify the **Screen** component.

Input Width

Currently, the width of all our input components is set to 100%. It would be nicer if we could overwrite the default so our **ListingEditScreen** would look the image to the right.

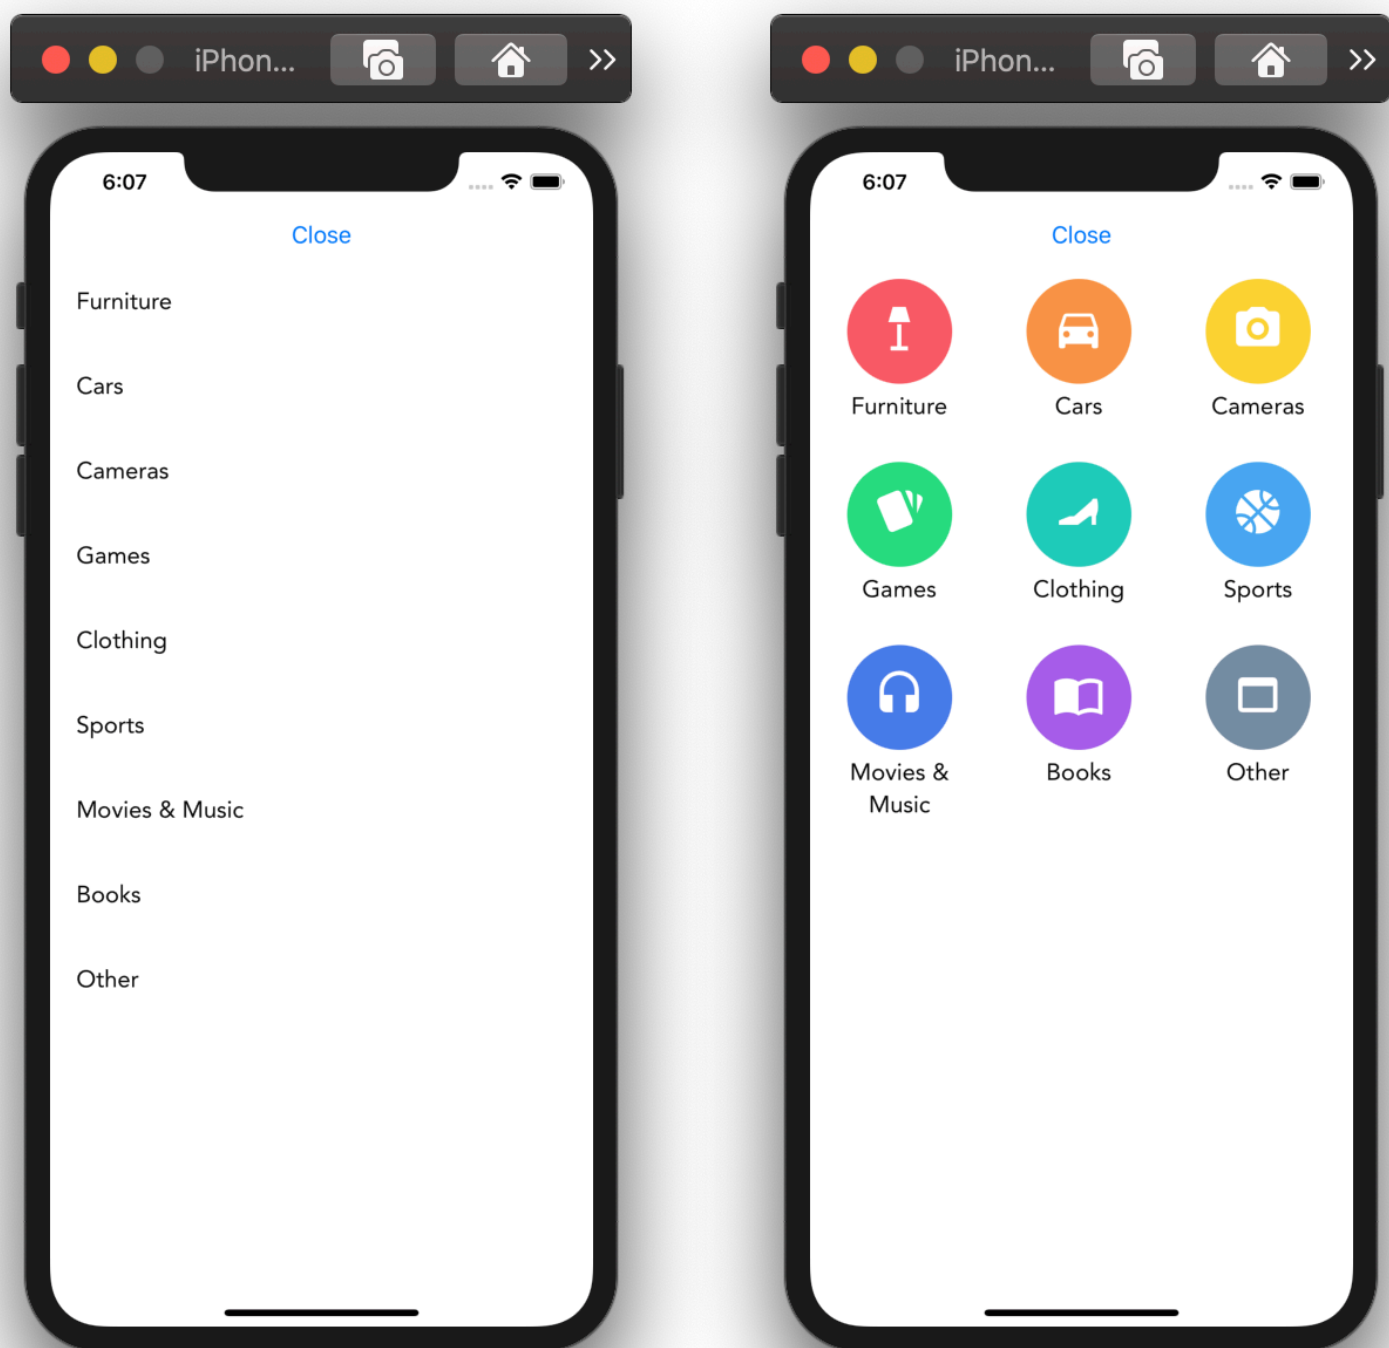

The price field should be small because here we only need 8 characters. The same goes for the category field.

Selecting Categories

Currently, when we tap on the category picker, we see a flat list of items (left image). While this interface works in most cases, we would like the list of our categories to be beautiful and colorful (right image).

You can find the icons/colors I have used on the next page. But what matters the most is how you extend the existing the picker component to support showing beautiful items.

Here are the colors/icons you need:

Category	Icon	Background Color
Furniture	floor-lamp	#fc5c65
Cars	car	#fd9644
Cameras	camera	#fed330
Games	cards	#26de81
Clothing	shoe-heel	#2bcbba
Sports	basketball	#45aaf2
Movies & Music	headphones	#4b7bec
